PartyLinker

Social network for sharing and joining events.
Repository: https://github.com/DESCombine/PartyLinker

Design

Creation of mockup and color palette.

Registration and login

Each user can register on the social network and can belong to two groups: organizers and participants; each user registers as a participant but can subsequently decide whether to activate his account as an organizer.

Home with feed of posts from followed users

Every time a user or an event decides to upload content, this will be reported in the home feed of each user they follow.

Comments on the post

Each user can comment under any type of post, even tagging other users. Any comment deemed inappropriate can be removed by the owner of the post. Each user can like comments or remove their own.

Post with text and/or photo

A user can post a photo in relation to an event they have been to. Furthermore, an organizer can also publish a poster of a new event by having to fill out a form with the minimum and additional directives defined by the site:

- Image*
- Place*
- Data*
- Timetables*
- Guests
- Number of seats*
- Cost
- Minimum age
- Short description*

(*marked fields are mandatory)

Each user who posts a photo can decide whether to tag other users.
A user who views the poster post has the possibility of clicking a button that ensures or retrieves the user's participation in the event. The list of participants is then visible to anyone. Furthermore, on any photo there is an info button that takes you to the event page.

User follow

Each user can decide to follow the pages of other users.

User profile with posts, follows and followers

Each user has a profile in which all the posts he has published are visible, divided between published photos and organized events. If photos are viewed then only photos strictly published by the user at any event will be displayed. On the other hand, if the events are viewed then only the event posters will be present which can be expanded to the event page; this page groups together: all the associated information, any post published at that event and the participating users.

Notifications

Each user can decide whether to be notified by email for the following sectors:
- Publication of event poster
- Tags in posts
- Tags in comments
- New follower
- Like to post or comment
- Comment in post

WOW effect

The user can decide whether to activate two-factor authentication which will be required every time you try to access a new device: a code is sent to the email. If the user does not tick the "remember me" box when logging in, then it will be necessary to log in every time he logs in after some time.
A map can be displayed where all events that are still recent can be viewed based on where they will be held.
Who is using the social network can be viewed in real time.
Partial search in the "Search" screen.
Translate button below the post description.
